

Module Handbook

Master Course of Studies

”Data and Computer Science”

Universität Heidelberg
Fakultät für Mathematik und Informatik

**Version as of 15.07.2026, corresponding to examination regulations of 22.07.2010
with changes dated 03.02.2013, 29.09.2021 and 05.10.2022**

Form of study: full time

Type of study: consecutive

Regular period of study: 4 semesters

Number of credit points to gain in this study: 120

Location of study: Heidelberg

Number of places: 50

Fee: According to general regulations of Heidelberg University

1 Qualification objectives, profile, and particularities of the degree program

1.1 Preamble - Qualification objectives of Heidelberg University

In keeping with Heidelberg University's mission statement and constitution, degree programmes are designed to provide a comprehensive academic education, incorporating subject-specific, cross-disciplinary, and career-related objectives that prepare students for their future professional careers. The resulting skills profile is a valid qualification profile that is included in the module handbooks for all university disciplines and is implemented in each degree programme's specific qualification objectives, curricula, and modules:

- Development of subject-specific skills, with a particular emphasis on research;
- Development of the skills required for trans-disciplinary dialogue;
- Development of practical problem-solving skills;
- Development of personal and social skills;
- Promotion of students' willingness to assume social responsibility on the basis of the skills acquired.

1.2 Profile of the degree program

The master's program Data and Computer Science is operated by the Faculty of Mathematics and Computer Science. The master's program is research-oriented. It deepens and broadens the expertise, enables independent scientific work, lays the foundations for further development of the subject, and prepares students for a demanding professional career or a doctorate. Graduates are qualified for responsible and leadership activities.

The master's program focuses on data science and computer science, thereby bridging the emerging field of data science with a well-established field. Particular interest in data science is put on subject areas such as machine learning, visual computing, and data analysis, while computer science covers scientific computing, software systems and engineering, computer engineering and systems as well as algorithms and theoretical computer science. Including an applied field enables students to obtain in-depth knowledge and skills in an applied area such as in the natural sciences, including medicine, biology, and physics, but also in the social sciences and humanities. Thus, this master's program allows to cover all aspects from fundamental methods of data science and computer science to engineering-related aspects, and research and development in an application domain.

The master's program allows a free choice of the course of study in order to facilitate an early entry into research-related as well as innovative practical subject areas. In particular, it allows the student to individualize the study program to a large extent, addressing particular needs and interests.

Current research topics and details about the master's program Data and Computer Science can be found on the website <https://www.informatik.uni-heidelberg.de>.

1.3 Subject-specific qualification objectives of the degree program

The graduates of the master's program Data and Computer Science in particular the competencies of bachelor's graduates, in detail:

- They have knowledge in practical, theoretical, technical and applied computer science and the methods of mathematics and can apply these to solve concrete computer science problems.
- They can plan, carry out, document and present a computer science task self-reliantly.
- They can work on a problem from the field of computer science using scientific methods within a given period of time and develop and present proposed solutions.
- They master scientifically-based methods of programming and can apply them practically in projects. This includes the scientific methods of designing, implementing and debugging software.
- They know the concepts of designing and analyzing efficient algorithms and are able to use them when creating software.
- They know the basics of the use of operating systems and management of resources and are able to use this knowledge in the design, implementation, and optimization of computer systems.
- They know the problems and importance of reliability in modern computing systems and computer networks and are able to take this knowledge into account in the planning, implementation and control of such systems.

In addition, graduates of the master's program Data and Computer Science the following professional qualifications beyond the learning outcomes of the bachelor's program.

- They are able to independently plan, design and evaluate extensive computing systems under given technical and economic constraints and to manage associated software projects.
- They have in-depth knowledge in one or more special areas of computer science such as data analysis, requirements engineering, distributed systems, computer systems, and can apply this knowledge practically in the design and development of computing systems.
- They are able to decompose complex computing systems into abstract components (software and hardware) and determine and evaluate possibilities of realization according to given constraints, as well as to plan and implement this realization.
- They are able to independently familiarize themselves with future techniques of computer science, i.e. interdisciplinary areas, to apply them in projects, to communicate them professionally, and to develop them from a scientific point of view.

1.4 Generic qualification objectives of the degree program

Graduates of the master's program Data and Computer Science should possess the following basic competencies of an interdisciplinary nature in the context of computer science.

- They possess problem-solving skills and are proficient in the application of knowledge in the field of computer science and additionally in a broader subject context or related disciplines. In addition, they are able to apply these skills in new, unfamiliar situations.
- They have the competence to work in a team as well as to take on more prominent responsibilities in a team (team leadership).
- They are able to communicate their own conclusions based on the current state of research and application and to exchange ideas on a scientific level.
- They possess the competence to independently collect information, make judgements and independently acquire knowledge in the field of computer science as well as related disciplines. In particular, they are capable of procuring and interpreting research literature and evaluating alternative solutions in the field of computer science as well as across disciplines.
- In addition, they are able to deal effectively with complex problems and situations, possess decision-making skills, and can independently carry out research- or application-oriented projects.
- They are able to communicate effectively in professional matters orally and in writing.

1.5 Particularities of the degree program and module descriptions

1.5.1 Reason for modules with less than 5 credit points

There are some modules in this program with less than 5 credit points. These modules are self-contained units of study in terms of content and cannot reasonably be combined with other modules.

1.5.2 Description of the teaching and learning forms

- **Lecture:** Presentation of the course content by the lecturer using appropriate media; interaction and questions are possible.
- **Exercise:** Exercises and smaller parts of the syllabus are explained; questions, interaction and discussion by and with the students to understand the syllabus and the example exercises.
- **Seminar:** Independent development of a scientific topic, preparation of a presentation, giving the presentation with subsequent questions and discussion of the participants about the presentation.
- **Practical:** Project work on the basis of a programming task, independent development of software including documentation, preparation of a project report and a presentation of the project.

1.5.3 Modalities for examinations

At the beginning of each course, the details and, in particular, any deviations from the modalities for examinations listed below, will be announced by the lecturer orally and written.

Many modules have a uniform regulation for the awarding of the CP (Credit Points), so this regulation is described in detail here and then only referred to in the module descriptions.

Rules for awarding CP. CPs are awarded if the final examination is passed. The details of the final examination are described in the individual module descriptions. Many modules include exercise sessions using various models. The requirements for admission to the final examination are determined by the lecturer at the beginning of the course and announced in writing. This admission is valid for the current and the next two semesters (both examination periods each, see below), i.e. for modules offered annually, after admission, the final examination can be taken in this semester or one year later in both exam periods. After that, a renewed admission to the final examination in the exercise group must be acquired.

Examination scheme. This part of the module description specifies the number of attempts which are allowed to pass the module, according to the examination regulations. Once an exam is passed, it cannot be repeated in order to improve the grade.

1+1: after the first attempt, there is only one repetition possible.

Examination period. Two exam periods have been designated for the written exams at the end of each semester. The first exam period lasts three weeks and consists of the last week of the lecture period and the first two weeks of the lecture-free period. The second exam period lasts three weeks and consists of the last two weeks of the lecture-free period and the first week of the lecture period. In exceptional cases, exams may take place outside of these exam periods; lecturers must announce such exceptions at the beginning of the course.

For oral exams, the dates are set by the lecturers.

Examination dates. For modules offered once a year or less frequently, and for which the module exam is a written exam, two exam dates are always offered following the module. These exams are scheduled during the first and second exam periods, respectively. Students choose which of the offered exam dates they wish to take.

For smaller (up to 50 students) or irregularly offered modules, exceptions to this rule may be made. The lecturers must announce any such exceptions at the beginning of the course.

For modules that are offered every semester and have a written exam as the module exam, there is only one exam date following the module, within the first exam period. Students who fail or withdraw for a valid reason may retake the exam in the following semester.

2 Model study plan and mobility

2.1 Model study plan

1st year:		
	Elective Area	44 CP
	Application Field / Elective Area	10 CP
	General competencies / Elective area	6 CP
sum		60 CP
2nd year:		
	Master's Advanced Seminar	4 CP
	Master's Advanced Practical	8 CP
	Elective Area	6 CP
	Application Field / Elective Area	8 CP
	Master's Thesis	30 CP
	Master's Colloquium	4 CP
sum		60 CP
total:		120 CP

2.2 Mobility window

The mobility window for the master's program Data and Computer Science is usually located in the second and third semester, nevertheless a study visit to another university in Germany or abroad can also take place in another semester. The planning of such a study visit should be started early. Especially for a stay abroad, the organization phase can easily take a year. Information on studying abroad can be found on the Erasmus program for computer science <https://www.mathinf.uni-heidelberg.de/de/outreach/internationales/austauschprogramme>.

3 Compulsory modules

The master's program Data and Computer Science consists of the following compulsory modules (short summaries solely provided for improved understanding, for details please refer to the module handbook entries that follow afterwards):

- **Master's Advanced Seminar:** the preparation and delivery of a scientific presentation of a selected topic including a discussion.
- **Master's Advanced Practical:** practical work on a selected topic of advanced computer science, in particular recommended as preparation of the master's thesis.
- **Application Field:** obtaining in-depth knowledge and skills from one of the application areas listed in the examination regulations, thereby extending knowledge beyond the scope of computer science. Optionally, it is possible to conduct the application field using modules from the master's program Data and Computer Science.
- **Master's Thesis:** theoretical and practical work as well as thesis writing on an advanced scientific topic of computer science.
- **Master's Colloquium:** presentation and defense of the results obtained during the work on the master's thesis.

They are described in the following.

Master's Advanced Seminar

LV-Nr. 110024XXXX	Name Master's Advanced Seminar	Abbreviation IMS
CP 4	Duration one semester	Offered each semester
Format 2 SWS seminar + 2 SWS tutorial	Workload 120h; thereof 30h presence study 90h preparation talk and report	Availability M.Sc. Data and Computer Science
Language German or English	Lecturer(s) depending on teaching offer	Examination scheme 1+1
Learning objectives	<p>Students will deepen, practice and demonstrate</p> <ul style="list-style-type: none"> - the ability to present advanced scientific literature and facts in a lecture in a factual and objective manner, - knowledge of scientific writing techniques (including, in particular, literature research), and the ability to access advanced scientific literature, - the advanced ability to discuss and give feedback on presentations, - the ability to write a short and concise scientific paper on advanced scientific literature and issues, - the advanced ability to provide feedback on scientific papers, - the advanced ability to ask critical questions about scientific presentations. 	
Learning content	<ul style="list-style-type: none"> - Improvement of scientific writing techniques and scientific feedback, - In-depth practice in the development and presentation of advanced scientific literature and topics, - Selected advanced topics from computer science. 	
Requirements for participation	recommended: knowledge in the topic of the seminar	
Requirements for the assignment of credits and final grade	<p>The module is completed with a graded examination. This examination includes the preparation and delivery of a presentation of at most 30 minutes (a talk of about 20 minutes is recommended) as well as a written report of about 10 pages. After the presentation, a round of questions takes place in which all students are required to ask questions; participation in this question round is part of the grading.</p> <p>Students must confirm that no genAI tools were used to create the content of slides or written report. More detailed regulations regarding the format of the paper and the presentation will be agreed upon at the beginning of the course. The examination must be passed in order to be awarded the CP. The final grade of the module is determined by the grade of the examination.</p>

Master's Advanced Practical

LV-Nr. 1100253XXX	Name Master's Advanced Practical	Abbreviation IMP
CP 8	Duration one semester	Offered each semester
Format Practical 6 SWS	Workload 240h; thereof at least 25h presence 10h preparation presentation	Availability M.Sc. Data and Computer Science
Language German or English	Lecturer(s) depending on teaching offer	Examination scheme 1+1
Learning objectives	<p>The students</p> <ul style="list-style-type: none"> - acquire in-depth problem-solving competence for complex design and implementation tasks, - are able to clearly present, demonstrate and apply problem analysis and description techniques, - deepen programming knowledge in the respective programming language required for the project, - are able to carry out the project with the help of a software development environment. <p>In addition, project-specific skills are deepened, especially working in a team (of up to three students):</p> <ul style="list-style-type: none"> - Implementation and evaluation of projects, - Planning and execution of project and team work. <p>The soft skills to be trained thus include in particular the ability to work in a team, refinement of presentation techniques, understanding scientific literature as well as independent work.</p>	
Learning content	<p>Domain knowledge dependent on lecturer; general learning content includes</p> <ul style="list-style-type: none"> - Deepening knowledge about the project's topic, - Independent development of complex software and its documentation. 	
Requirements for participation		
Requirements for the assignment of credits and final grade	<p>The module is completed with a graded examination. This examination includes the assessment of the project results (software, documentation), the project report (5-10 pages), and the presentation (approx. 30 minutes plus discussion). The grade of this examination gives the grade for this module. More details will be given by the lecturer.</p>	

Useful literature	
-------------------	--

Application Field

LV-Nr.	Name Application Field	Abbreviation IAF
CP 18	Duration	Offered
Format Lecture, exercise, or practical	Workload 540h; division into attendance, practice and presence time in consultation with the lecturers	Availability M.Sc. Data and Computer Science
Language English or German	Lecturer(s) various, depending on application field	Examination scheme
Learning objectives	in-depth knowledge and skills in an application area	
Learning content	<ul style="list-style-type: none"> - Selection of an application area according to the rules of the examination regulations, - Determination of and participation in modules from the application area (CPs correspond to the specifications from the application area). It must be ensured that no modules from the application area are chosen that have already been taken in the Bachelor's program, - (optional) Definition and implementation of an interdisciplinary project by a lecturer from the application area and computer science. The project goal shall include a computer science achievement in the application area. Workload and thus CPs are determined by the lecturer. Contents shall be documented in a project report and a presentation. 	
Requirements for participation	recommended: same application field as in the bachelor studies	
Requirements for the assignment of credits and final grade	<p>The examination credits can be obtained through non-informatics modules at bachelor's or master's level. Of the 18 CP, up to 10 CP can be earned through an interdisciplinary project.</p> <p>Examination credits in the application area and (optionally) for the interdisciplinary project (analogous to the module IMAP) are weighted according to the respective share of CP. Modules shall be graded, ungraded modules will only be admitted in justified exceptional cases.</p>	
Useful literature		

Master's Thesis

LV-Nr.	Name Master's Thesis	Abbreviation IMT
CP 30	Duration 6 months	Offered continuous
Format supervised self-study	Workload 900 h processing of an individual topic (research and development work) and written elaboration	Availability M.Sc. Data and Computer Science
Language German or English	Lecturer(s) varying	Examination scheme 1+1
Learning objectives	- Use of the acquired technical knowledge and methods to independently solve a complex problem from computer science and its applications, - Ability to independently produce a scientific thesis.	
Learning content	Independent scientific work on a demanding problem from the field of computer science and its applications	
Requirements for participation	45 CP (exam regulations - PO); elective modules, IMS and IMP recommended	
Requirements for the assignment of credits and final grade	Passing the graded master's thesis is required for the award of the CP. The Master's thesis includes regular consulting with advisor and the written elaboration.	
Useful literature	will be announced by the advisor	

Master's Colloquium

LV-Nr.	Name Master's Colloquium	Abbreviation IMC
CP 4	Duration	Offered continuous
Format Colloquium	Workload 120h; Preparation presentation, guiding questions, and discussion; delivering presentation; defending discussion	Availability M.Sc. Data and Computer Science
Language German or English	Lecturer(s) depending on teaching offer	Examination scheme 1+1
Learning objectives	<p>The students</p> <ul style="list-style-type: none"> - acquire, practice and demonstrate the ability to present their own challenging work in a scientific presentation in an unbiased manner, - gain skills and experience in defending advanced scientific topics, - are able to position themselves clearly in their field, to communicate this, and, based on sound arguments, to defend the results of their own work in the context of the current state of the art in the context of a discussion. 	
Learning content	<ul style="list-style-type: none"> - Presentation of the content of the master's thesis, especially the advantages and limitations as well as a comparison to the current state of the art, - Discussion, based on prepared guiding questions as well as open questions of different levels. Teachers as well as fellow students are allowed to participate in the discussion to cover thematically broadened views in terms of background and perspective, - Content assessment of the paper is left to the examiner, with the focus of the colloquium assessment on the quality of the candidate's discussion and argumentation. 	
Requirements for participation	completed master's thesis (recommended)	
Requirements for the assignment of credits and final grade	<p>The module is completed with a graded examination. This examination includes the evaluation of the presentation (a presentation of at most 30 minutes is recommended) and the student's ability to defend the results of their work in the face of questions and comments (approximately 15-45 minutes). Total time should not exceed 90 minutes. The examination must be passed in order to be awarded the LP. The final grade of the module is determined by the grade of the examination.</p>	
Useful literature		

4 Elective modules

In the following, the elective modules of the master's program Data and Computer Science are described. Specializations can (but do not have to) be chosen, in which case the following information should be considered. As described in the examination regulations, three areas have to be covered when choosing modules. The assignment of the modules to the areas is described in the following. Subsequently, the descriptions of the specializations follow and, after this, the individual module descriptions.

Besides the modules from computer science (Section 2.3), up to one Master's Advanced Practical can be credited as elective module.

It is possible to credit modules from the Bachelor's degree program Computer Science to the compulsory area of this Masters's degree program on application at the Examination Board, in case basic knowledge required to achieve respective learning objects is missing. For further details please refer to Appendix B of the examination regulations of the Master's degree Data and Computer Science. Please note that such application is mandatory prior to taking the respective course.

4.1 Module assignment to subject areas

In accordance with the specifications stated in the examination regulations, three of the following subject areas have to be covered with at least 6 CP each. The available areas as well as the modules assigned to these areas are listed in the following. For details about these modules, please refer to Section 2.3 and following. Modules not listed in this subsection are not assigned to any specific area.

The subject areas are as follows:

- Visual Computing (VC)
- Software Systems and Engineering (SE)
- Scientific Computing (SC)
- Algorithmic Data Analysis and Machine Learning (AM)
- Algorithmics and Theoretical Computer Science (AT)
- Computer Engineering (CE)

Module	VC	SE	SC	AM	AT	CE
Advanced Software Engineering (IASE)		•				
Algorithm Engineering (IAE)					•	
Algorithmic Randomness and Computable Analysis (IARCA)					•	
Applied Combinatorial Optimization (IACO)					•	
Artificial Intelligence for Programming (IAIP)				•		
Automated Planning (IAuPl)					•	
Complex Network Analysis (ICNA)					•	
Computational Geometry (ICGeo)	•					
Computer Games (ICS)	•					
Computer Vision (ICV)	•					
Discrete Structures 2 (IDS2)					•	
Distributed and Parallel Algorithms (IDPA)					•	
Generative Neural Networks for the Sciences (IGNNS)				•		
Geometric Modeling and Animation (IGMA)	•					
Hardware Aware Scientific Computing (IHASC)			•			
Inverse Probleme (IIP)			•			
IT Project Management (IPM)		•				
IT-Sicherheit 2 (IITS2)		•				
Knowledge Management and Decision-Making in Software Engineering (ISWKM)		•				
Machine Learning Essentials (IMLE)				•		
Machine Learning and Physics (MKTP6)				•		
Mining Massive Datasets (IMMD)				•		
Model-Based Time Series Analysis (IMBTSA)				•		
Model Checking (IMoCh)					•	
Natural Language Processing with Transformers (INLPT)				•		
Practical Geometry (IPGeo)	•					
Reinforcement Learning (IRL)				•		
Scientific Visualization (ISV)	•					
Software Economics (ISWEco)		•				
Software Evolution (ISWEvol)		•				
Volume Visualization (IVV)	•					
All basic & advanced modules of the MSc Computer Engineering (MScTI)						•

Table 4.1: Module assignment to subject areas.

4.2 Modules from computer science

The modules from computer science are described below in alphabetical order.

Advanced Software Engineering

LV-Nr. L 1100222032 E 1100222033	Name Advanced Software Engineering	Abbreviation IASE
CP	Duration	Offered usually every summer semester
Format Lecture 2 SWS + Exercise course 2 SWS	Workload 180 h; thereof 60 h lectures and tutorials, 15 h preparation for exam, 105 h lecture wrap-up and homework	Availability M.Sc. Data and Computer Science
Language English	Lecturer(s) Sebastian Baltes	Examination scheme 1+1
Learning objectives	Building on the Software Engineering module (ISE), this module expands on the concepts, procedures, methods, and tools of modern software engineering and introduces new ones. Students should apply and deepen selected procedures, methods, and tools using examples and case studies. In particular, analysis and design skills are deepened, which are of central importance for developing software systems. In addition, methodological skills in project management, quality assurance, and other areas are deepened.	
Learning content	<ul style="list-style-type: none"> - Software Development Tools: Deepening of the previously introduced tools, especially the static code analysis tools. Tools for large-scale refactoring and automated security analysis. - Software Architecture: Focus on event-driven architectures and microservices, domain-driven design. - Software Testing: Advanced approaches such as mutation testing, fuzzing, property-based testing, or symbolic execution. - APIs: APIs as contracts, REST vs. GraphQL vs. gRPC, Java Bean Validation. - Java Virtual Machine: Kotlin is used to demonstrate the interoperability of programming languages on the Java Virtual Machine and to highlight their differences and special features. - Software Supply Chains: Software Bill of Material, integration in CI/CD pipelines. - Cloud-native Software Development: Deepening the concept of containerization, introduction of Kubernetes and serverless functions, cost models in the cloud, authentication and authorization, multitenancy. - Frontend Development: Overview of modern frameworks such as Angular, React or Vue.js, cross-platform apps. 	
Requirements for participation	recommended are: Algorithmen und Datenstrukturen, Einführung ins Software Engineering, Fortgeschrittenenpraktikum	

Requirements for the assignment of credits and final grade	The module is completed with a graded written examination. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations.
Useful literature	<p>In addition to the literature from module Einführung in Software Engineering (ISE):</p> <p>A. Zeller, R. Gopinath, M. Böhme, G. Fraser, C. Holler: The Fuzzing Book, CISP, 2024.</p> <p>O. Zimmermann, M. Stocker, D. Lübke, U. Zdun, C. Jausovec: Cloud Native - Using containers, functions, and data to build next-generation applications, O'Reilly Media, 2019.</p> <p>K. Indrasiri, S. Suhothayan: Design Patterns for Cloud Native Applications - Patterns in Practice Using APIs, Data, Events, and Streams, O'Reilly Media, 2021.</p>

Algorithm Engineering

LV-Nr. L 1100222000 E 1100222001	Name Algorithm Engineering	Abbreviation IAE
CP 8	Duration one semester	Offered every summer semester
Format Lecture 4 SWS + Exercise course 2 SWS	Workload 240h; thereof 90h lectures and tutorials, 15h exam preparations, 135h lecture wrap-up and homework	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language English	Lecturer(s) Christian Schulz	Examination scheme 1+1
Learning objectives	<p>Students</p> <ul style="list-style-type: none"> - obtain a systematic understanding of algorithmic questions and solution approaches in the area of algorithm engineering, - are able to transfer the learned techniques onto similar problems and be able to interpret and understand current research topics in the area of algorithm engineering, - are able to select appropriate algorithms to come up with and implement efficient solutions, given a real-world problem, - know realistic machine models and applications, algorithm design, implementation techniques, experimental methodology and can interpret measurements. 	
Learning content	<p>The listed abilities will be learned by concrete examples. In particular, we will almost always cover the best practical and theoretical methods. This methods often deviate a lot by the algorithms learned in the basic courses. To this end the lecture covers FPT/Kernelization in practice (independent set, vertex cover, (all) minimum cuts (NOI algorithm), clique cover, node ordering), multi-level algorithms (graph partitioning, modularity clustering, dynamic clustering, process mapping, spectral techniques, exact approaches), route planning (contraction hierarchies, arc-flags, hub-label algorithm), dynamic graph algorithms (single-source reachability, transitive closure, matching, minimum cuts, graph generation).</p>	
Requirements for participation	<p>recommended are: Einführung in die Praktische Informatik (IPI), Programmierkurs (IPK), Algorithmen und Datenstrukturen (IAD), Mathematik für die Informatik 1 oder Lineare Algebra 1 (MA4), Algorithms and Data Structures 2 (IADS2)</p>	
Requirements for the assignment of credits and final grade	<p>The module is completed with a graded oral examination. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations.</p>

Algorithmic Randomness and Computable Analysis

LV-Nr. L 1100222040	Name Algorithmic Randomness and Computable Analysis	Abbreviation IARCA
CP	Duration	Offered irregular
Format Lecture 2 SWS	Workload 120h; thereof 30h lectures, 15h exam preparations, 75h lecture wrap-up and homework	Availability M.Sc. Data and Computer Science M.Sc. Mathematik M.Sc. Scientific Computing
Language English	Lecturer(s) Ivan Titov	Examination scheme 1+1
Learning objectives	The students will learn basics of computability theory and information theory and obtain basic knowledge of algorithmic randomness and computable analysis; after passing the course, they will be able to differentiate between various randomness concepts and relate them to notions of approximability of real numbers.	
Learning content	Turing machines and Computability. Various notions of Kolmogorov complexity. The main approaches to characterize effective randomness: typicality, unpredictability and incompressibility. Effective approximability of real numbers and randomness of reals. Relative randomness and reducibilities. Basics of computable analysis.	
Requirements for participation	recommended are: basic knowledge of Turing machines and computability theory	
Requirements for the assignment of credits and final grade	The module is completed with a graded oral examination. The final grade of the module is determined by the grade of the examination.

Applied Combinatorial Optimization

LV-Nr. 1300282205	Name Applied Combinatorial Optimization	Abbreviation IACO
CP 8	Duration one semester	Offered every winter semester
Format Lecture 4 SWS + Exercise course 2 SWS	Workload 240 h; thereof 60 h lectures 30 h exercises 24 h preparation for exam 126 h self-study and working on assignments/projects (optionally in groups)	Availability M.Sc. Data and Computer Science M.Sc. Mathematik M.Sc. Scientific Computing Cannot be combined with Optimization for Machine Learning.
Language English	Lecturer(s) Bogdan Savchynskyy	Examination scheme 1+1
Learning objectives	<p>The students</p> <ul style="list-style-type: none"> - can analyze combinatorial optimization methods and estimate the area of their potential application; - can competently apply existing optimization algorithms and program packages; - know typical combinatorial optimization techniques and have a sufficient background for an independent literature search; - understand the basics of convex analysis, convex optimization, convex duality theory, (integer) linear programs and their geometry. 	

Learning content	<p>The course is devoted to combinatorial optimization, which includes but not limited to algorithms on graphs, integer linear programming, pseudo-boolean optimization, matroids and submodularity.</p> <p>A distinctive feature of this course is its motivation by machine learning applications, which shifts the optimization focus from attaining an optimal solution to a problem, to obtaining an accurate enough solution very fast. The reason for this shift is complexity of models used in modern artificial intelligence-related branches and the lesson they teach us: Better results can be easier attained by more accurate models rather than by more accurate optimization.</p> <p>To build an accurate problem model, the latter must be learnable. To be used in learning pipelines, combinatorial algorithms must be fast. To attain the best practical results, the algorithms must be accurate enough.</p> <p>Fast, accurate enough and learnable algorithms are three aspects we address in this lecture.</p> <ul style="list-style-type: none"> - Combinatorial problems and their computational complexity: Overview - Linear and integer linear programs and their geometry: Convexity, polyhedra, LP relaxation. - Lifting of variables: Quadratic to linear problem transform, Sherali-Adams hierarchy - Lagrange duality: Subgradient, optimality conditions, relation to LP relaxation, reduced costs. - Systematic exact combinatorial methods: Branching and cutting. - Scalable dual techniques: Non-smooth first order methods, smoothing, primal-dual algorithm. - Greedy algorithms: (Sub-)Optimality, matroids. - Quadratic pseudo-boolean optimization: Algorithms, applications, submodularity. - Scalable primal heuristics: Greedy generation, local search and optimal recombination. Memetic algorithms. - Min-cost-flow: Problem subclasses, theoretical properties and practical algorithms. - Learning parameters of combinatorial problems from training data: Black-box differentiation and recent advances in the literature.
Requirements for participation	<p>recommended are: basic courses: Linear Algebra, Analysis (or, equivalently, Mathematics for computer science) and Algorithms and data structures.</p>
Requirements for the assignment of credits and final grade	<p>The module is completed with a graded oral examination. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations.</p>

Artificial Intelligence for Programming

LV-Nr.	Name Artificial Intelligence for Programming	Abbreviation IAIP
CP 6	Duration one semester	Offered at least every 4th semester
Format Lecture 2 SWS + Exercise course 2 SWS	Workload 180 h; thereof 60 h lecture 15 h preparation for exam 105 h self-study and working on assignments (optionally in groups)	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language English	Lecturer(s) Artur Andrzejak	Examination scheme 1+1
Learning objectives	<p>Expected learning outcomes are:</p> <ul style="list-style-type: none"> - Knowledge of selected classical methods in artificial intelligence, in particular knowledge representation, search methods, rule systems, - Basic knowledge about probabilistic models and probabilistic programming, - Knowledge of techniques for code representation and parsing, - Knowledge of techniques for modeling code via neural networks, - Knowledge of basic and advanced methods for program synthesis, - Familiarity with semantic parsing and code summarization, - Familiarity with selected applications of AI for programming, e.g. code-to-code translation, code recommendations, and detection of bugs in code. 	
Learning content	<p>This module covers the following topics:</p> <ul style="list-style-type: none"> - Introduction to classical methods in artificial intelligence, in particular knowledge representation, search methods, rule systems, - Introduction to probabilistic models and probabilistic programming, - Fundamentals of code representation and parsing, - Modeling of code via neural networks and sequence models/transformers, - Basic and advanced methods for program synthesis, - Introduction to semantic parsing and code summarization, - State-of-the-art applications of AI for programming, e.g. code-to-code translation, code recommendations, detection of vulnerabilities in code. 	
Requirements for participation	<p>Skills in programming (preferably Python) and elementary knowledge of probability theory / statistics. Recommended prerequisites are lectures in machine learning, e.g. Foundations of machine learning.</p>	
Requirements for the assignment of credits and final grade	<p>The module is completed with a graded oral or written examination. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations.</p>

Automated Planning

LV-Nr. L 1100222034 E 1100222035	Name Automated Planning	Abbreviation IAuPl
CP	Duration	Offered irregular
Format Lecture 2 SWS + Exercise course 2 SWS	Workload 180 h; thereof 60 h lectures and tutorials, 15 h preparation for exam, 105 h lecture wrap-up and homework	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language English	Lecturer(s) Daniel Gnad	Examination scheme 1+1
Learning objectives	Students can: <ul style="list-style-type: none"> - model planning problems in a common formalism - implement common search techniques and heuristics - compare planning methods - apply planning algorithms to solve planning problems - analyze the performance of planning algorithms - discuss the complexity of planning problems 	
Learning content	<ul style="list-style-type: none"> - planning formalisms (STRIPS, FDR, PDDL) - structural analysis of planning problems - planning as heuristic search - common heuristic functions (delete relaxation, landmarks, abstractions) - complexity of solving planning problems - search space reduction techniques - symbolic planning (planning as SAT) 	
Requirements for participation	recommended are: Algorithmen und Datenstrukturen, Artificial Intelligence	
Requirements for the assignment of credits and final grade	The module is completed with a graded written examination. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations.

Complex Network Analysis

LV-Nr.	Name Complex Network Analysis	Abbreviation ICNA
CP 8	Duration one semester	Offered every 2nd wintersemester
Format Lecture 4 SWS + Exercise course 2 SWS	Workload 240 h; thereof 90 h lecture 20 h preparation for exam 130 h self-study and working on assignments/projects (optionally in groups)	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing B.Sc. Mathematik
Language English	Lecturer(s) Michael Gertz	Examination scheme 1+1
Learning objectives	<p>Students</p> <ul style="list-style-type: none"> - can describe basic measures and characteristics of complex networks, - can implement and apply basic network analysis algorithms using programming environments such as R or Python, - can describe different network models and can describe, compute, and analyze characteristic parameters of these models, - know how to compute different complex network measures and how to interpret these measures, - know different generative models for constructing complex networks, especially scale-free networks, - know the fundamental methods for the detection of communities in networks and the analysis of their evolution over time, - are familiar with basic concepts of network robustness, - understand the principles behind the spread of phenomena in complex networks. 	
Learning content	<ul style="list-style-type: none"> - Graph theory and graph algorithms; basic network measures - Random networks and their characteristics (degree distribution, component sizes, clustering coefficient, network evolution), small world phenomena - Scale-free property of networks, power-laws, hubs, universality - Barabasi-Albert model, growth and preferential attachment, degree dynamics, diameter and clustering coefficient - Evolving networks, Bianconi-Barabasi model, fitness, Bose-Einstein condensation - Degree correlation, assortativity, degree correlations, structural cutoffs - Network robustness, percolation theory, attack tolerance, cascading failures - Communities, modularity, community detection and evolution - Spreading phenomena, epidemic modeling, contact networks, immunization, epidemic prediction 	
Requirements for participation	recommended are: Algorithmen und Datenstrukturen (IAD), Lineare Algebra I (MA4), Einführung in die Wahrscheinlichkeitstheorie und Statistik (MA 8)	

Requirements for the assignment of credits and final grade	The module is completed with a graded written examination. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations.

Computer Games (Game Engine Design)

LV-Nr. 1300132220	Name Computer Games (Game Engine Design)	Abbreviation ICS
CP 8	Duration one semester	Offered every summer semester
Format Lecture 3 SWS + Exercise 2 SWS	Workload 240 h; thereof 75 h lectures and tutorials 15 h exam preparations 150 h self-study and exercises	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language English	Lecturer(s) Jürgen Hesser	Examination scheme 1+1
Learning objectives	<p>The students</p> <ul style="list-style-type: none"> - understand the game engine concepts, the decision for specialized class structures, support tools, and the typical architectural elements and are able to apply these concepts in developing an own game engine, - are able to apply and further develop methods for visualizing 3D scenes, perform collision detection and hereby are able to identify the appropriate algorithms, - have the capability to develop animation methods with different levels of complexity and are able to assess which method to take under the trade-off between performance and quality, - will be able to find and apply appropriate techniques for path planning, to improve the found paths to be more realistic, - are able to identify the different concepts of AI in games and develop and apply these techniques for own games. <p>In the exercises, they apply the theoretical concepts and program applications in order to see how to translate concepts into code.</p>	
Learning content	<ul style="list-style-type: none"> - Overview of the structure and the components of computer games - Architecture of Game Engines - Elements of the Graphics Subengine - Algorithms for Collision Detection - Animation techniques and physics - Path planning and AI 	
Requirements for participation	recommended are: Einführung in die Praktische Informatik (IPI), Programmierkurs (IPK), Algorithmen und Datenstrukturen (IAD)	
Requirements for the assignment of credits and final grade	The module is completed with a graded oral or written examination. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations.

Computer Vision

LV-Nr. 1300282207	Name Computer Vision	Abbreviation ICV
CP	Duration one semester	Offered every semester
Format Lecture 2 SWS + Exercise 2 SWS	Workload 180 h; thereof 30 h lectures 30 h exercises 20 h revision and home exercise 70 h programming a mini research project 30 h preparation of final report	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language English	Lecturer(s) Carsten Rother	Examination scheme 1+1
Learning objectives	<p>The students</p> <ul style="list-style-type: none"> - understand and implement the principles behind estimating 3D Point-Clouds and Motion from two or more images. They are able to apply this knowledge to new tasks in the field of 3D reconstruction. - understand the principles of image processing and image formation. This can be utilized to design an algorithm for camera calibration. - have studied various techniques for fast object recognition. This can be used to build an object recognition system for e.g. autonomous driving. - understand different approaches for object tracking. - have studied methods for conditional image generation. This can be used to build an image generation technique in a new domain, e.g. fashion design. - understand and implement methods that combine machine learning-based methods with classical computer vision-based techniques. - have studied various state-of-the-art computer vision systems and approaches, and are then able to evaluate and classify new systems and approaches. 	
Learning content	<p>This lecture covers a broad range of areas in computer vision: Image Processing, 3D Reconstruction, Object Tracking, Image Understanding, and Image Generation. For instance, we will discuss the underlying techniques and associated theory to recover a 3D scene from a set of photographs. A focus of the lecture is to investigate techniques from deep learning, e.g. vision transformers, traditional approaches, e.g. RANSAC, and mixtures of the two, e.g. Differentiable RANSAC. We also introduce the necessary background knowledge, e.g. basic Deep Learning, Image Formation Models, Camera Models, Kalman Filters, Diffusion Models, etc.</p>	
Requirements for participation	recommended is a basic machine learning background (e.g. Machine Learning Essentials)	

Requirements for the assignment of credits and final grade	The module is completed with a graded oral or written examination or a graded final report (about 10 pages). The grade of this examination gives the grade for this module. Details for this examination as well as the requirements for the assignment of credits will be given by the lecturer an the beginning of this course.
Useful literature	

Discrete Structures 2

LV-Nr. L 1100222002 E 1100222003	Name Discrete Structures 2	Abbreviation IDS2
CP 8	Duration one semester	Offered every summer semester
Format Lecture 4 SWS + Exercise course 2 SWS	Workload 240 h; thereof 90 h lecture 20 h preparation for exam 130 h self-study and working on assignments/projects (optionally in groups)	Availability M.Sc. Data and Computer Science M.Sc. Mathematik
Language English	Lecturer(s) Felix Joos	Examination scheme 1+1
Learning objectives	Students - understand several advanced graph parameters and the central theorems in these areas, - can solve problems involving discussed topics, - can reprove the central considered results.	
Learning content	- Probabilistic Methods - Extremal graph theory - Expander graphs - Quasirandom graphs - Further advanced topics	
Requirements for participation	recommended: Discrete Structures 1	
Requirements for the assignment of credits and final grade	The module is completed with a graded oral or written examination. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations.

Generative Neural Networks for the Sciences

LV-Nr. L 1100222010 E 1100222011	Name Generative Neural Networks for the Sciences	Abbreviation IGNNS
CP	Duration	Offered in (irregular) alternation with "Machine Learning"
Format Lecture 4 SWS + Exercise course 2 SWS	Workload 240h; thereof 60h lecture 90h tutorials, homework, lecture wrap-up 90h graded final report	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language English	Lecturer(s) Ullrich Köthe	Examination scheme 1+1
Learning objectives	<p>Students</p> <ul style="list-style-type: none"> - get to know a broad range of generative neural network design and learning methods, with an emphasis on solving problems in the sciences, - understand the strengths and limitations of these methods, can apply them to real-world problems and objectively assess the quality of the results, - familiarize themselves with important open-source implementations of these methods. 	
Learning content	<ul style="list-style-type: none"> - Types of generative neural networks: normalizing flows, diffusion models, (variational) autoencoders, recurrent networks, transformers - Techniques: simulation-based inference, hierarchical models, physics-informed neural networks, symbolic regression, causal discovery - Quality diagnostics: predictive accuracy, probabilistic calibration, re-simulation error, disentanglement scores, generalization ability, and pitfalls of those diagnostics - Applications: design of efficient surrogates for classical models, Bayesian inference for inverse problems, analysis of dynamic systems, with examples from physics, medicine, engineering, cognitive science, and others 	
Requirements for participation	recommended: basic knowledge of deep learning and statistics	
Requirements for the assignment of credits and final grade	The module is completed with a graded written exam. This exam is a report on a 90 h mini-research project. The final grade of the module is determined by the grade of the exam. The requirements for the assignment of credits follows the regulations in section modalities for exams. Details will be given by the lecturer.

Hardware Aware Scientific Computing

LV-Nr. L 1100222030 E 1100222031	Name Hardware Aware Scientific Computing	Abbreviation IHASC
CP 8	Duration one semester	Offered irregular
Format Lecture 4 SWS + Exercise Course 2 SWS	Workload 240h; thereof 90h lecture 15h preparation for exam 135h self-study and working on assignments/projects (optionally in groups)	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language English	Lecturer(s) Peter Bastian	Examination scheme 1+1
Learning objectives	Students - are familiar with different forms of parallelism in modern computer architectures, - can exploit this parallelism selecting an appropriate programming model, - are familiar with modelling of parallelism and know fundamental parallel algorithms from scientific computing.	
Learning content	Parallel Computer Architecture - Pipelining and super-scalar processors, SIMD vectorisation - Caches - Multicore architectures - GPUs - Communication networks Programming Models - Shared memory programming with OpenMP and C++ threads - OpenCL or Cuda - Task-based programming - Message-passing, MPI Parallel Algorithms - Speedup & scalability - Roofline model - Linear Algebra: Matrix-Vector, Matrix multiplication, solving dense systems, solving sparse systems - Iterative Solution of Linear Systems - High-Performance Libraries - Differential equations - Particle Methods	

Requirements for participation	basic knowledge in computer architecture and numerical methods; good programming skills in C++
Requirements for the assignment of credits and final grade	The module is completed with a graded examination. The final grade of the module is determined by the grade of the examination. Details for this examination as well as the requirements for the assignment of credits will be given by the lecturer at the beginning of this course.

IT-Sicherheit 2

LV-Nr. V 1100222004 Ü 1100222005	Name IT-Sicherheit 2	Abbreviation IITS2, ITSec2
CP 6	Duration ein Semester	Offered unregelmäßig
Format Vorlesung 2 SWS + Übung 2 SWS	Workload 180 h; davon 60 h Präsenzstudium 15 h Prüfungsvorbereitung 105 h Selbststudium und Aufgabenbearbeitung (eventuell in Gruppen)	Availability nicht kombinierbar mit Modul IT-Sicherheit für 8 LP M.Sc. Data and Computer Science
Language Deutsch	Lecturer(s) Vincent Heuveline	Examination scheme 1+1
Learning objectives	<p>Studierende</p> <ul style="list-style-type: none"> - erwerben umfangreiches Wissen über die Funktionsweise und Verwundbarkeiten vernetzter Computersysteme und können somit Konzepte zur IT-Netzsicherheit bewerten und entwerfen, - erlangen erweiterte Kenntnisse über die Sicherung großer Netzwerke und der Kommunikationsinfrastruktur (Routing, Namensauflösung, Internet-Firewalls, Intrusion Detection Systeme), - erwerben vertiefte Kompetenzen zur Detektion von Cyberangriffen, - erwerben grundlegende Kompetenzen im Bereich Penetration Testing. <p>Langfristiges Ausbildungsziel: Einsatz- und Beschäftigungsfähigkeit in der Breite des Arbeitsfeldes IT-Sicherheit.</p>	
Learning content	<p>Der IT-Sicherheit kommt bei der allgegenwärtigen Digitalisierung eine Schlüsselrolle zu. Die Vorlesung IT-Sicherheit 2 vermittelt methodische Ansätze zur Modellierung und Bewertung von Angriffsszenarien, auf Basis welcher technische Gegenmaßnahmen umgesetzt werden können. Insbesondere werden folgende Schwerpunkte adressiert:</p> <ul style="list-style-type: none"> - Sicherheitsmodelle und Bewertungskriterien - Authentifikationsverfahren - Schutz von Kommunikationsinfrastruktur; Netzsicherheit - Digitale Identität - Software-Exploitation - Penetration Testing - Zero Trust Security <p>Mit Hilfe von virtuellen Maschinen in einem geschützten Bereich werden klassische Angriffs- und Schutzszenarien praktisch untersucht.</p>	

Requirements for participation	empfohlen ist: IT-Sicherheit 1 (IITS1)
Requirements for the assignment of credits and final grade	Das Modul wird mit einer benoteten Klausur abgeschlossen. Die Modulendnote wird durch die Note der Klausur festgelegt. Für die Vergabe der LP gilt die Regelung aus dem Kapitel Prüfungsmodalitäten.

Machine Learning Essentials

LV-Nr. L 1100222006 E 1100222007	Name Machine Learning Essentials	Abbreviation IMLE
CP 8	Duration one semester	Offered irregular
Format Lecture 4 SWS + Exercise course 2 SWS	Workload 240h; thereof 60h lecture 90h tutorials, homework, lecture wrap-up 90h graded final report	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language English	Lecturer(s) Ullrich Köthe	Examination scheme 1+1
Learning objectives	<p>The students</p> <ul style="list-style-type: none"> - understand a broad range of machine learning concepts, get to know established and advanced learning methods and algorithms, - are able to apply them to real-world problems, and can objectively assess the quality of the results. - learn how to use Python-based machine learning software such as scikit-learn. 	
Learning content	<p>Classification (linear and quadratic discriminant analysis, neural networks, linear and kernelized support vector machines, decision trees and random forests), least squares and regularized regression, Gaussian processes, unsupervised learning (density estimation, cluster analysis, Gaussian mixture models and expectation maximization, principal component analysis, bilinear decompositions), directed probabilistic graphical models, optimization for machine learning, structured learning</p>	
Requirements for participation	<p>recommended are: solid knowledge of basic calculus, statistics, and linear algebra</p>	
Requirements for the assignment of credits and final grade	<p>The module is completed with a graded written examination. This examination is a report on a 90 h mini-research project. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations. Details will be given by the lecturer.</p>

Model-Based Time Series Analysis

LV-Nr. L 1100222028 E 1100222029	Name Model-Based Time Series Analysis	Abbreviation IMBTSA
CP	Duration	Offered irregular
Format Lecture 4 SWS + Exercise course 2 SWS	Workload 240h, thereof 60h lecture, 30h exercises, 126h self-study and working on assignments (optionally in groups), 24h exam preparation	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing Renaming of Time Series Analysis With Applications to Cognitive Science
Language English	Lecturer(s) Georgia Koppe	Examination scheme 1+1
Learning objectives	Students are familiarized with fundamental concepts of time series analysis, understand a variety of different time series models, and learn appropriate statistical inference frameworks. Students learn which models are suitable for a given problem, how to assess model performance, and how to select from a set of different models. The acquired knowledge enables students to generalize problem settings to new real world data sets, select or develop suitable statistical time series models for data analysis, and self-implement these models into code.	
Learning content	Fundamental concepts in time series analysis, data preprocessing and visualization, linear regression, simple autoregressive models for stochastic processes (normal, Bernoulli, Poisson), model assessment and selection, cognitive computational models (discounted decision making, sequential sampling, reinforcement learning models), active learning with cognitive models, latent variable models, Hidden-Markov-models, state space models for stochastic processes (normal, Poisson), discrete-time nonlinear dynamical systems models (variants of recurrent neural network models and inference schemes)s	
Requirements for participation	recommended prior knowledge in basic calculus, statistics, and linear algebra	
Requirements for the assignment of credits and final grade	The module is completed with a graded oral or written examination. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations.

Model Checking

LV-Nr. L 1100222036 E 1100222037	Name Model Checking	Abbreviation IMoCh
CP	Duration	Offered irregular
Format Lecture 2 SWS + Exercise course 2 SWS	Workload 180 h; thereof 60 h lectures and tutorials, 15 h preparation for exam, 105 h lecture wrap-up and homework	Availability M.Sc. Data and Computer Science
Language English	Lecturer(s) Daniel Gnad	Examination scheme 1+1
Learning objectives	Students can: <ul style="list-style-type: none"> - model concurrent systems using automata - express safety and liveness properties in LTL and CTL - use model checking algorithms to verify system properties - describe the expressiveness of different model checking formalisms - apply reduction techniques to simplify model checking problems - use symbolic search to solve model checking problems 	
Learning content	<ul style="list-style-type: none"> - Transition systems and automata - Concurrent processes, communication via channels - System properties: safety, liveness, linear temporal logic (LTL), branching time logic (CTL) - LTL and CTL model checking - Complexity of model checking problems - state-space reduction methods (bisimulation) - symbolic model checking with binary decision diagrams 	
Requirements for participation	recommended are: Algorithmen und Datenstrukturen, Einführung in die Theoretische Informatik	
Requirements for the assignment of credits and final grade	The module is completed with a graded written examination. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations.	
Useful literature	Principles of Model Checking; Christel Bayer, Joost-Pieter Katoen	

Natural Language Processing with Transformers

LV-Nr.	Name Natural Language Processing with Transformers	Abbreviation INLPT
CP	Duration	Offered every 2nd winter semester
Format Lecture 2 h + Exercise course 2 h	Workload 180 h; thereof 60 h lecture 120 h self-study and working on assignments/projects (optionally in groups)	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language English	Lecturer(s) Michael Gertz	Examination scheme 1+1
Learning objectives	<p>Students</p> <ul style="list-style-type: none"> - fully understand the principles and methods underlying word embedding approaches, - are familiar with traditional sequence-to-sequence machine learning methods, - can describe the key concepts and techniques underlying attention mechanisms and different transformer architectures, - understanding training and fine-tuning approaches to improve the performance of different transformer architectures for different downstream NLP tasks, - know the key methods and architectural components for building QA and text summarization pipelines, - can build and deploy QA and text summarization pipelines using common software frameworks, - know key metrics in evaluating transformer architectures for different applications, - can implement diverse transformer-based NLP applications using common Python frameworks and libraries, - can deploy transformer-based NLP applications through Web interfaces. 	
Learning content	<ul style="list-style-type: none"> - Word embeddings (review of simple neural network architectures and concepts) - Sequence-to-sequence models (Recurrent Neural Networks, LSTM, GRU) - Attention mechanism - Transformer components (encoder, decoder) and common transformer architectures (BERT, GPT, T5) - Training and fine-tuning transformers, including zero- and few-shot learning - Text summarization approaches - Question answering and building a QA pipeline - Transformer architectures for conversational AI - Programming and model frameworks such as Huggingface, LangChain, OpenAI and (cloud-based) vector databases 	

Requirements for participation	<p>Recommended courses: Data Science for Text Analytics (IDSTA), Foundations of Machine Learning (IML)</p> <p>Recommended background: solid knowledge of basic calculus, statistics, and linear algebra; good Python programming skills; familiarity with frameworks such as Huggingface, Google Colab, and cloud-based services, in particular vector databases</p>
Requirements for the assignment of credits and final grade	<p>Assignments (40%) and Programming Project (60%); about 4-5 assignments focusing on the material learned in class on a conceptual and formal level; group project in which 3-4 students develop a prototypical transformer-based application, including design and evaluation, a written project documentation as well as the code need to be submitted at the end of the class, clearly indicating which part of the project each student is responsible for. Both assignments and project must be at least satisfactory (4,0) in order to pass the class.</p>
Useful literature	<p>For the different topics, several research papers will be provided to students via the Moodle platform. The following textbooks are useful but not required:</p> <p>Lewis Tunstall, Leandro von Werra, and Thomas Wolf. Natural Language Processing with Transformers, 2022 (revised edition)</p> <p>Dan Jurafsky and James H. Martin. Speech and Language Processing (3rd ed. draft)</p> <p>Furthermore, during the course of this lecture, several papers covering topics discussed in class will be provided.</p>

Practical Geometry

LV-Nr.	Name Practical Geometry	Abbreviation IPGeo
CP 4	Duration one semester	Offered irregularly
Format Lecture 2 SWS + Exercise course 1 SWS	Workload 120h; thereof 45 h lecture 60 h self-study and working on assignments 15h preparation for exam	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language English	Lecturer(s) Susanne Krömker	Examination scheme 1+1
Learning objectives	<p>The students</p> <ul style="list-style-type: none"> - understand basic geometric concepts for data analysis as well as efficient point search and further processing of measurement data - confidently handle projections and descriptions beyond the three-dimensional world of experience, - calculate geometric invariants, distances, curvatures from measurement data, reconstructed and generated surfaces. 	
Learning content	<p>Basic areas of geometry with relevance in computer graphics, image processing, pattern recognition, computer vision and geometric modeling.</p> <p>(i) Analytic geometry: operations on vector spaces with appropriate coordinates and mappings (affine mappings, collinearities), geometric fitting of point clouds to linear structures or planes from error-prone measurement data</p> <p>(ii) Projective geometry: central projection and inverse reconstruction of 3D objects from planar images (computer vision, geodesy), differences between B-spline curves and surfaces and the class of NURBS, freeform geometries in CAD systems</p> <p>(iii) Differential geometry: parameter representations in geometric data processing, implicit representations (level sets), estimation of invariants from discrete data (triangulations, point clouds).</p>	
Requirements for participation	recommended are: linear algebra, computational geometry and any programming language (e.g. C/C++/Pascal/python)	
Requirements for the assignment of credits and final grade	The module is completed with a graded oral examination. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations.

Projektseminar Biomedizinische Bildanalyse

LV-Nr.	Name Projektseminar Biomedizinische Bildanalyse	Abbreviation IPBB
CP 6	Duration ein Semester	Offered jedes Sommersemester
Format 2 Teile Seminar und Projekt, 4 SWS	Workload 180 h (je zur Hälfte Seminar und Projekt); 60 h Präsenzstudium 120 h Selbststudium und Aufgabenbearbeitung (evtl. in Gruppen)	Availability M.Sc. Data and Computer Science
Language Deutsch	Lecturer(s) Karl Rohr	Examination scheme 1+1
Learning objectives	<p>Die Studierenden</p> <ul style="list-style-type: none"> - erlangen vertiefte Kenntnisse und Fähigkeiten im Gebiet Biomedizinische Bildanalyse, - lernen fortgeschrittene Methoden und Algorithmen zur automatischen Analyse biomedizinischer Bilder, - lernen wie man Algorithmen und Software für automatische Bildanalyse entwickelt <p>erweitern ihre Fähigkeiten Projektergebnisse mündlich zu präsentieren und schriftlich zu dokumentieren,</p> <ul style="list-style-type: none"> - erweitern ihre Fähigkeiten zur Teamarbeit und zur Strukturierung von Projekten. 	
Learning content	<p>Die Studierenden arbeiten in Teams an ausgewählten fortgeschrittenen Themen der Biomedizinischen Bildanalyse. Der Schwerpunkt liegt auf der automatischen Analyse von Zellmikroskopiebildern und medizinischen tomographischen Bildern. Beispiele für Themen sind die Segmentierung und Verfolgung (Tracking) von Zellen in Mikroskopiebildern, die Segmentierung von Blutgefäßen in tomographischen Bildern sowie die Registrierung von Magnetresonanz (MR) Bildern des menschlichen Gehirns. Die Veranstaltung besteht aus einem Seminarteil (Einarbeitung in die relevante Literatur, Erarbeitung der theoretischen Grundlagen, Vortragspräsentation) und einem Projektteil (Spezifikation eines Softwaresystems, Entwurf von Algorithmen und Implementierung von Bildanalyseverfahren, Test und Evaluierung der Verfahren, Präsentation der Ergebnisse).</p>	
Requirements for participation	empfohlen sind: Grundkenntnisse in Bildverarbeitung (Computer Vision, Image Analysis), Programmierkenntnisse, Kenntnisse in Software Engineering	

Requirements for the assignment of credits and final grade	Das Modul wird mit einer benoteten Prüfung abgeschlossen. Diese Prüfung umfasst Vortragspräsentationen von Zwischen- und Endergebnissen (jeder Studierende 4 Vorträge je ca. 10 Min. und anschließender Diskussion) und eine schriftliche Ausarbeitung der theoretischen Grundlagen, der verwendeten Methoden und der Ergebnisse (jeder Studierende ca. 10 Seiten). Zur Vergabe der LP muss diese Prüfung bestanden werden. Die Modulendnote wird durch die Note der Prüfung festgelegt.
Useful literature	Bekanntgabe in der Lehrveranstaltung

Reinforcement Learning

LV-Nr. L 1100222038 E 1100222039	Name Reinforcement Learning	Abbreviation IRL
CP	Duration	Offered irregular
Format Lecture 2 SWS + Exercise course 2 SWS	Workload 180 h; thereof 60 h lectures and tutorials, 15 h preparation for exam, 105 h lecture wrap-up and homework	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language English	Lecturer(s) Georgia Koppe	Examination scheme 1+1
Learning objectives	<p>Students</p> <ul style="list-style-type: none"> - understand the foundations of reinforcement learning embedded in the Markov decision process (MDP) framework - can derive and analyze value functions, policies, and dynamic programming methods - understand Monte Carlo and temporal-difference prediction and control - can implement core reinforcement learning algorithms in self-written code - evaluate trade-offs between model-free and model-based methods and relate them to cognitive and computational models of learning and decision-making 	
Learning content	<ul style="list-style-type: none"> - Core concepts of reinforcement learning: reward signals, returns, Markov property - The Markov decision process formalism: states, actions, transitions, and value functions - Dynamic programming methods: policy evaluation, policy iteration, value iteration - Monte Carlo and temporal-difference learning: TD(0), SARSA, Q-learning - Planning and model-based reinforcement learning: Dyna, prioritized sweeping - Function approximation and generalization: linear function approximation, stochastic gradient descent - Policy gradient methods and actor-critic architectures - Exploration versus exploitation and information-seeking behavior - Hierarchical and multi-step methods - Applications in artificial intelligence, control, and cognitive modeling - Evaluation of learning agents: convergence diagnostics, sample complexity, and performance metrics 	
Requirements for participation	recommended are: solid knowledge of basic calculus, linear algebra, and statistics, as well as Python programming skills	

Requirements for the assignment of credits and final grade	The module is completed with a graded examination. The final grade of the module is determined by the grade of the examination. Details for this examination as well as the requirements for the assignment of credits will be given by the lecturer at the beginning of this course.

Robotics and Machine Intelligence

LV-Nr. L 1100222042 E 1100222043	Name Robotics and Machine Intelligence	Abbreviation IRMI
CP 6	Duration one semester	Offered at least every 4th semester
Format Lecture 2 SWS + Exercise course 2 SWS	Workload 180 h; thereof 60 h lecture, 15 h preparation for exam, 105 h self-study and working on assignments (optionally in groups), including practical exercises on robot hardware	Availability M.Sc. Data and Computer Science
Language English	Lecturer(s) Artur Andrzejak	Examination scheme 1+1
Learning objectives	<p>The students:</p> <ul style="list-style-type: none"> - know the mathematical foundations of robot manipulators, including rigid-body transformations, forward and inverse kinematics, Jacobians, and trajectory generation, - understand basic robot dynamics and control and their limitations, motivating learning-based methods, - know deep learning methods for robot perception, in particular 2D and 3D computer vision, - know the main paradigms of learning robot behavior, in particular imitation learning and reinforcement learning, and can apply suitable algorithms to a given task, - understand the role of simulation, sim-to-real transfer, and safety when deploying learned policies on real robots, - know modern foundation-model approaches to robotics, in particular vision-language-action (VLA) models and self-supervised predictive architectures (e.g. JEPA), - are able to implement, train, and evaluate learning-based components of a robotic system on real robot arms. 	

Learning content	<p>This module covers the following topics:</p> <ul style="list-style-type: none"> - Foundations of robotics (about 25% of the course): rigid-body motions, forward and inverse kinematics, Jacobians, trajectory generation, and an overview of dynamics and classical control - Deep learning for robot perception: convolutional networks and vision transformers, object detection and segmentation, pose estimation, 3D vision, camera calibration - Imitation learning: behavior cloning, distribution shift, interactive approaches (e.g. DAgger), demonstration collection via teleoperation - Reinforcement learning for robotics: Markov decision processes, value-based methods, policy gradient and actor-critic algorithms, reward design - Simulation and sim-to-real transfer: physics simulators, domain randomization, safety aspects of real-robot training - Foundation models for robotics: vision-language models, vision-language-action (VLA) models, and self-supervised world models such as Joint Embedding Predictive Architectures (JEPA) - Practical and theoretical exercises with two AR4 robot arms (kinematics, calibration, demonstration collection, training and deployment of learned policies)
Requirements for participation	Recommended are knowledge of Python, linear algebra, and elementary probability theory / statistics. Prior knowledge of machine learning is helpful but not required; a self-study crash course on machine learning fundamentals is offered before the start of the lecture.
Requirements for the assignment of credits and final grade	The module is completed with a graded examination. The final grade of the module is determined by the grade of the examination. Details for this examination as well as the requirements for the assignment of credits will be given by the lecturer at the beginning of the course.

Software Evolution

LV-Nr. 1100222014	Name Software Evolution	Abbreviation ISWEvol
CP 3	Duration one semester	Offered irregularly
Format Lecture 2 SWS	Workload 90h; thereof 30h lecture 35h individual processing / self-study 25h preparation for exam (in groups possible / recommended)	Availability M.Sc. Data and Computer Science
Language English	Lecturer(s) Eckhart von Hahn	Examination scheme 1+1
Learning objectives	<p>After the successful participation in the lecture the students can</p> <ul style="list-style-type: none"> - create a maintenance concept for an existing software, - plan a software reengineering project from a technical / functional perspective, - develop a framework to enable a sustainable software development during the initial creation phase. <p>The students know afterwards</p> <ul style="list-style-type: none"> - the typology of software maintenance and the management of troubleshooting, - the classical array of software revitalization techniques (e.g. refactoring), - the difference and the challenges of progressive development versus the initial creation of software and on which aspects you have to pay particular attention – through the lense of the provider of a software as well as the user of a software, - in general the relevance of the topic for the industrial engineering practice. 	
Learning content	<p>This module intends to convey the concepts for a successful software engineering lifecycle after its initial creation.</p> <p>The content of the lecture is assembled on the background of the lecturers doctoral research and 20 years of corresponding Software Engineering experience in the (industrial) practice, based on current and classical literature:</p> <ul style="list-style-type: none"> - Disambiguation of terms - Software Maintenance - Software Reengineering - Progressive Software Development / Software Evolution in particular and its management - Software Migration 	
Requirements for participation	recommended are knowledge and skills taught in the module Introduction to Software Engineering (ISE)	

Requirements for the assignment of credits and final grade	The module is concluded with a graded exam - oral or written. Details are provided at the beginning of the lecture.

Volume Visualization

LV-Nr. 1300132218	Name Volume Visualization	Abbreviation IVV
CP 8	Duration one semester	Offered every summer semester
Format Lecture 2 SWS + Exercise course 2 SWS + Homework	Workload 240 h; thereof 60 h lectures and tutorials 15 h exam preparations 165 h self-study and exercises / homework	Availability M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language English	Lecturer(s) Jürgen Hesser	Examination scheme 1+1
Learning objectives	<p>The students</p> <ul style="list-style-type: none"> - learn to understand how to use techniques of volume visualization to render complex scientific data, this consists of the representation of data by surface or volume elements, the conversion of different representations and techniques of interpolation, - understand the physical principles of volume rendering, the different strategies of their realization with advantages and disadvantages, they should critically assess different techniques and their parallelization. 	
Learning content	<ul style="list-style-type: none"> - Introduction of the visualization of scientific data of natural sciences and bio-sciences - Discrete and continuous representation of data and methods of interpolation - Methods of conversion between surface and volume representations and their efficient realizations - Theory of volume rendering and their different realizations - Acceleration and parallelization of volume rendering - Machine Learning for Image Generation 	
Requirements for participation	recommended are: Introduction into computer science I (IPI), programming course (IPK), algorithms & data structures (IAD);	
Requirements for the assignment of credits and final grade	The module is completed with a graded written examination. The final grade of the module is determined by the grade of the examination. The requirements for the assignment of credits follows the regulations in section modalities for examinations.

4.3 Modules from BSc/MSc Mathematics

4.3.1 Bachelor of Mathematics

The following modules from the Bachelor of Mathematics with 100% subject content can be credited:

- Probability Theory (MC4)
- Numerics (MD1)
- Statistics (MD2)
- Introduction to Optimization (MD3)

4.3.2 Master of Mathematics

From the Master of Mathematics, the following courses from the following modules can be credited.

Basic Module Numerics and Optimization (MM15)

- Nonlinear Optimization
- Uncertainty Quantification 1

Specialization Module Numerics and Optimization (MM35)

- Computational Fluid Dynamics
- Fundamentals of Computational Environmental Physics
- Mathematical Methods of Image and Pattern Analysis II

From the supplementary modules

- Computability and Complexity I
- Computability and Complexity II

4.4 Modules from MSc Physics

From the MSc Physics the module *Machine Learning and Physics (MKTP6)* can be credited in the MSc Data and Computer Science. The description of the module can be found in the current module handbook of the MSc Physics.

4.5 Modules from the MSc Computer Engineering

All subject-related modules from the MSc Computer Engineering can also be credited in the MSc Data and Computer Science according to the content requirements. The modules offered can be found in the current module handbook of the Master of Computer Engineering.

5 Interdisciplinary competencies

Interdisciplinary competencies (in German *Übergreifende Kompetenzen ÜK*) refer to study contents, key competencies and additional qualifications that go beyond subject-specific knowledge and convey personality and job-related competencies that are essential in today's professional life (in and outside of research). A maximum of 6 credit points can be earned in the area of interdisciplinary competencies (ÜK). There are various choices available (some module descriptions follow on the next pages). Within the framework of the ÜK, courses from the university's range of courses that do not belong to the computer science program or the application area can be accepted. This includes language courses, but not courses of the Heidelberg University Computer Center (URZ). In this case, the credit points of the courses are transferred (especially for language courses). Courses offered by the Career Service in the area of ÜK can be recognized; in this case, it is essential to consult with the Examination Office beforehand. Furthermore, irregular offers of the faculty marked as ÜK can be taken.

From the Master of Computer Engineering the module *Entrepreneurship* can be chosen, it is recognized with 6 LP. For the module description please refer to the module handbook of the Master Computer Engineering course of studies. The module *Tools* can not be chosen.

Introduction to LaTeX

LV-Nr. L 1100180005 E 1100180006	Name Introduction to LaTeX	Abbreviation MLat
CP 3 ÜK	Duration one semester	Offered annually
Format Lecture 2 SWS + Exercise 2 SWS	Workload 90 h; thereof 30 h lecture 30 h exercise 30 h self-study	Availability B.Sc. Informatik B.Sc. Mathematik M.Sc. Data and Computer Science M.Sc. Scientific Computing M.Sc. Mathematics of Machine Learning and Data Science
Language English	Lecturer(s) varying	Examination scheme
Learning objectives	Students are able to - configure a LaTeX system (locally or online) - structure and edit complex LaTeX projects - identify and correct compile errors - select and utilize external packages - implement and use LaTeX macros	
Learning content	The course offers an introduction into the typesetting system LaTeX with a focus on its effective use in an academic and professional context, based on either a local installation or an online platform. Contents include - getting started with LaTeX - document structure and formatting - floating objects (figures, tables) - handling of bibliographies and citations - typesetting mathematical formulas - incorporation of external packages - graphical illustrations using TikZ - important types of documents (e.g., presentations, theses, CVs, letters) - development of custom macros and packages - directories and search paths	
Requirements for participation	none	
Requirements for the assignment of credits and final grade	Active participation in lectures and exercises	

Useful literature	to be announced in the lecture

Industrial Internship

LV-Nr.	Name Industrial Internship	Abbreviation IInd
CP 1 ÜK pro 30 h	Duration	Offered
Format Working in an industrial company	Workload 120 hours; thereof at least 110 hours presence in the company 10 hours to write the report	Availability B.Sc. Informatik M.Sc. Data and Computer Science
Language	Lecturer(s) Chairperson of the examination board	Examination scheme 1+1
Learning objectives	Learning and application of methods and tools in hardware and/or software development in an industrial context.	
Learning content	The industrial internship is intended to impart project-related application of IT methods in hardware and/or software development. Ideally, the internship should be embedded in a process (e.g., in software development) in which the task is clearly specified by the company and the solution is worked out during the internship (in a team). Tasks, such as pure software installation, hardware installation, operating system updates or customer help desk, do not count as internship content.	
Requirements for participation	Before starting an industrial internship, it should be clarified with the chairperson of the examination board of the degree course whether and to what extent the planned content of the internship can be credited.	
Requirements for the assignment of credits and final grade	The awarding of the CP does not only depend on the duration (time commitment) of the internship, but also on the content. For this purpose, an approx. 6-page, well-structured written report (PDF, A4, 11 pt, max. 1.5 line spacing) on the activities carried out, including the tasks and results, must be provided. A letter on the type and duration of the internship, signed by the supervisor in the company, must be attached to the report. The report is graded as pass or fail.

Education through Summer School, Holiday Course, or Conference

LV-Nr.	Name Education through Summer School, Holiday Course, or Conference	Abbreviation IBil
CP 1 ÜK pro 30 h	Duration	Offered
Format Participation in a computer science event with content that is not taught in the computer science degree course	Workload at least 30 hours presence at the event	Availability B.Sc. Informatik M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language	Lecturer(s) Chairperson of the examination board	Examination scheme 1+1
Learning objectives	Experience with subject-specific content that goes beyond the studies, including its intensive discussions.	
Learning content		
Requirements for participation		
Requirements for the assignment of credits and final grade	The module is concluded with an ungraded exam. This exam includes a written report on the event and the experiences gained (approx. 1 page per CP). This report must be passed in order for the CP to be awarded.	
Useful literature		

Study Abroad

LV-Nr.	Name Study Abroad	Abbreviation IAus
CP 4 ÜK für 3 Zeitmonate	Duration 3 Monate	Offered
Format Studies outside of Germany	Workload 160 hours; thereof 120h settling into the foreign study context 40h reflection and reporting	Availability B.Sc. Informatik M.Sc. Data and Computer Science M.Sc. Scientific Computing
Language	Lecturer(s) Chairperson of the examination board	Examination scheme 1+1
Learning objectives	Experience with everyday study life in a different country	
Learning content		
Requirements for participation		
Requirements for the assignment of credits and final grade	The module is concluded with an ungraded exam. This exam includes an approximately 4-page written report on the studies and the experiences made. This report must be passed in order for the CP to be awarded.
